student A strong answers

Submission A — mostly complete answers.

Q1

A database is an organized collection of related information. It makes searching data easier and helps reduce duplicate records.

Q2(a)

A primary key is a field that uniquely identifies every row in a table. Its values cannot be repeated, and it should not be empty.

Q3

A foreign key is a field that points to a key in another table. It links tables and helps prevent references to records that do not exist.

Q4

Normalization means arranging data into related tables to reduce repeated information. This improves consistency and avoids update problems.

Q5

A primary key identifies a row uniquely in its own table. A foreign key refers to a key in another table to link the tables.
