student C mapping edge cases

Submission C — mapping and continuation test.

Q1

A database is a collection of related data that can be managed and searched.

Q2(a)

A primary key uniquely identifies a record.

Q4

Normalization reduces duplication by arranging data into tables.

Continuation of Q4: It also reduces update and deletion anomalies and improves consistency.

Q6

A foreign key refers to a key in another table and maintains a relationship. Q6 is intentionally absent from the teacher paper; flag it as unmapped/review-required, do not assign it to Q3 or Q5.
