SE

Assignment - I

~~Ans-1 1. The Project "CreatorAssist-1~~

Ans-1) • The Project focuses on solving a specific real-world Problem related to content creators, such as content planning, quality analysis, and workflow managements.

• It is designed as a user-facing application that creators can directly interacts with through a web or mobile interface.

• The system uses pre-existing hardware and operating system rather than controlling or modifying system-level resources.

• Features like AI-based quality checking, content scheduling, and trend analysis work at the software application layer.

Ans-2) • The application can be integrated directly with the operating system to monitor camera, microphone, and storage resources in real time.

• System-level services can be added to automatically optimize camera settings, audio levels, and lighting suggestions at the device level.

• The Project can be extended to run as a background system service that continously analyzes content creation activities.

- It can directly interact with hardware components such as cameras, microphones, and GPUs.

- It can manage background services for continuous monitoring.

- This would convert the project into a system level solution.

Ans-3] The scope of the A Smart Assistant for content creators includes providing an integrated platform to help content creators plan, manage, and improve their digital content efficiently.

- The system allows users to organize content ideas, schedules, and brand collaborations in one centralized workspace. It includes AI-based quality analysis to evaluate video and image aspects such as lighting, background clarity, and camera angles.

- The system also supports trend-based audio and template suggestions to help creators stay relevant on social media platforms.

Ans-4]

- The system depends heavily on internet connectivity, especially for AI-based analysis and trend detection, which may limit usage in low-network areas.

- The accuracy of content quality analysis depends on the quality of input data, such as video resolution, lighting, and audio clarity.

- The system may have limited real-time performance due to hardware constraints like low processing power or limited memory on user devices.

Ans-5]

- The system shall allow users to create and manage content ideas in a structured format.

- The system shall provide a content scheduling feature to plan posts with deadlines.

- The system shall allow users to upload images or videos for quality analysis.

- The system shall suggest trending audio and templates based on current trends.

- The system shall analyze uploaded media and provide AI-based feedback on lighting, background, and camera angle.
